and remove the precipitate by centrifugation (Miller et al., 1988). This method avoids use of organic solvents but still requires an alcohol precipitation step to remove salts and concentrate the DNA, even though low quality DNA tends to be obtained.

Salting out relies on changes in solubility based on ionic strength. The ionic strength of a solution, I , is defined as. (1) $I = \frac{1}{2} \sum_i m_i z_i^2$. where. m_i is the concentration of the ion and. z_i is the charge of the ion. Total ionic strength of multiple ions is the sum of the ionic strengths of all of the ions.

(5) Salting-out extraction can greatly facilitate the recovery of organic compounds with minimal changes to an existing batch process and is operationally simple. (11) An added benefit is that salts will usually increase the density of the aqueous layer (12) making emulsions resulting from equi-dense layers, in cases of nonhalogenated solvents, unlikely.

Salting out (also known as salt-induced precipitation, salt fractionation, anti-solvent crystallization, precipitation crystallization, or drowning out) is an effect based on the electrolyte-non-electrolyte interaction, in which the non-electrolyte could be less soluble at high salt concentrations. It is used as a method of purification for proteins, as well as preventing protein denaturation due to excessively diluted samples during experiments.

Some nucleic acid extraction techniques that avoid the use of organic solvents have also been developed over the years. 1,6,11 In 1988, Miller et al 18 published a protocol that achieved DNA purification through protein precipitation at high salt concentration. The traditional protocol involves initial cell disruption and digestion with SDS-proteinase K, followed by the addition of high concentrations of salts, usually 6 M sodium ...
